

GLOBALFOUNDRIES Qualifies Synopsys' IC Validator for Signoff Verification on 22FDX Platform

MOUNTAIN VIEW, Calif., April 16, 2020 /PRNewswire/ --

Highlights:

- Collaboration delivers signoff accuracy and optimized performance for 22FDX platform
- Signoff-certified 22FDX DRC runsets are now available
- Comprehensive support for design tape-outs using IC Validator and 22FDX for DRC, LVS and fill capabilities

[Synopsys, Inc.](#) (Nasdaq: SNPS) today announced that GLOBALFOUNDRIES® (GF®) has qualified Synopsys' IC Validator for its 22FDX® platform. With [IC Validator physical verification](#), customers striving to take advantage of the low-power and performance benefits of GF's 22-nanometer FD-SOI technology can now quickly verify that their designs meet signoff requirements for manufacturability compliance and maximum yield. Signoff design rule check (DRC), design for manufacturability (DFM), layout vs schematic (LVS) and metal fill runsets and tech files are available today from GF.

"With its best-in-class performance, power consumption, and integration capability, our differentiated 22FDX platform continues to be the solution of choice for designers and innovators working in 5G mmWave, Edge AI, IoT, and automotive applications," said Richard Trihy, vice president of design enablement at GLOBALFOUNDRIES. "We were pleased to partner with Synopsys on this qualification, which signifies to designers they can now confidently signoff designs using IC Validator, while maximizing the high-performance and power efficiency benefits of 22FDX."

IC Validator, a key component of Synopsys' [Fusion Design Platform™](#), is a comprehensive and highly scalable physical verification solution including DRC, LVS, programmable electrical rule checks (PERC), dummy metal fill, and design-for-manufacturability (DFM) enhancement capabilities. IC Validator is architected for high performance and scalability that maximizes utilization of mainstream hardware, using smart memory-aware load scheduling and balancing technologies. It uses both multi-threading and distributed processing over multiple machines to provide scalability benefits that extend to more than a thousand CPUs.

"Physical verification closure within schedule is a key challenge for our customers because of the increasing manufacturing complexity," said Raja Tabet, senior vice president of engineering, Design Group at Synopsys. "Synopsys and GLOBALFOUNDRIES have a deep collaboration that ensures designers have timely access to performance-optimized runsets. The runsets, in parallel with the scalability of IC Validator's massively parallel architecture, provide designers with a fast and accurate path to physical signoff closure."

About Synopsys

Synopsys, Inc. (Nasdaq: SNPS) is the Silicon to Software™ partner for innovative companies developing the electronic products and software applications we rely on every day. As the world's 15th largest software company, Synopsys has a long history of being a global leader in electronic design automation (EDA) and semiconductor IP and is also growing its leadership in software security and quality solutions. Whether you're a system-on-chip (SoC) designer creating advanced semiconductors, or a software developer writing applications that require the highest security and quality, Synopsys has the solutions needed to deliver innovative, high-quality, secure products.
